Background

Travel Counsellor provides a convenient way to plan a trip using four apis:

- *Google places* is used to retrieve places of interest to the user
- *OpenStreetMap* is used to convert geoposition to street name (and vice versa)
- *Google maps* is used to display the chosen trip of the user
- *Yahoo Weather* is used to display the weather at the chosen location

- HTTP
- CSS
- Javascript
- PHP
- MariaDB / SQL

Usage

Travel Counsellor is used this way:

1. The user enters a position or uses the geo location locator to provide the app with a place of reference
2. The user selects his search type
3. The user press *Start Search*
4. The places corresponding to the user's search are displayed as well as the weather there
5. The user selects one or more places for hos trip
6. The user clicks *Overview* or *Navigation* to be taken to our display of the trip or *Google Maps*
